AFRIFUTURES

Fair Prices. Transparent Markets. African Trade.

We put real-time commodity price data on-chain so African farmers and traders can transact without middlemen taxing their ignorance.

Cardano Genesis Program

01 / THE PROBLEM

Middlemen control the price data.

Because farmers don't know the real market price, they get paid far less than their crops are worth. The middlemen aren't providing value — they're just taxing ignorance.

20–40%

of income lost
to predatory pricing

500M+

smallholder farmers
across Africa

$1T+

African commodity
market annually

02 / THE INSIGHT

The problem isn't a lack of buyers or sellers. **It's a lack of truth.**

In these markets, information is the only thing that's scarce. Whoever controls the information controls the profit.

Current Reality

Price is a secret held by middlemen. Farmers negotiate blind.

With Afrifutures

Price is a public fact verified by the network. Power shifts to producers.

A transparent financial layer for African trade —

where the real price is public knowledge and any farmer or trader can transact without a middleman taking a cut.

Transparent Prices

Open Access

Middleman-Free

04 / THE SOLUTION

Built on Cardano. Powered by Truth.

We're building a decentralized price board and trading infrastructure that provides real-time, verifiable price data and prediction markets that allow traders to hedge risk.

"I think the price is X" → ***"The network proves the price is X"***

Price Board

Decentralized, on-chain commodity prices updated in real-time from verified market feeds.

Prediction Markets

Traders hedge risk with transparent, permissionless prediction markets for future prices.

Trustless Oracle

Cardano-native oracles provide formally verified, tamper-proof price attestations.

05 / HOW IT WORKS

Strip the middlemen of their only leverage: secrecy.

By moving price discovery to a public blockchain, we make price data a public good. When a farmer can see the real-time price on their phone, the middleman has to pay a fair price — or the farmer finds another buyer.

1

Market Data

Verified price feeds from exchanges & brokers

2

On-Chain Oracle

Cardano blockchain records & attests the real price

3

Farmer's Phone

Real-time price visible to any participant

4

Fair Transaction

Middleman must compete — or be bypassed

Massive. Fragmented. Waiting.

African commodity trading is one of the largest untapped financial markets on earth — but it's fragmented, opaque, and built on informal trust. We're starting where the pain is sharpest.

Beachhead Strategy

Start with: **Cocoa & Coffee in West Africa**

Once trust is established in one commodity, expanding to others is a matter of adding data feeds — not rebuilding the system.

Scale Opportunity

$45B	Cocoa global market
$90B	Coffee global market
$1T+	African commodities total

It's not about efficiency. It's about survival.

For the Farmer

Survival

Without price transparency, farmers lose 20–40% of their annual income to predatory pricing. This isn't about margins — it's about whether their families eat. Afrifutures gives them something to negotiate with: the truth.

For the Trader

Certainty

Without real price data or hedging tools, commodity trading is guesswork disguised as commerce. Afrifutures provides the infrastructure to see real prices and protect against volatility — turning gambling into strategy.

We need more than a database. We need a trustless oracle.

Farmers' livelihoods depend on this infrastructure. It cannot break, be manipulated, or be owned by any one party. Cardano's focus on formal verification and identity makes it the right foundation.

Formal Verification

Smart contract correctness is mathematically proven, not just tested.

Decentralised Identity

On-chain identity allows farmers and traders to build verifiable reputation.

Plutus Security

Eradanu's EUTXO model prevents entire classes of exploits common on EVM chains.

Genesis Ecosystem

Access to builder support, funding, and a network committed to impact infrastructure.
